

ALDABRA[®]

MARINE

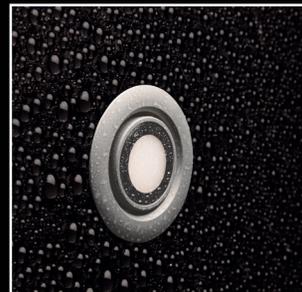

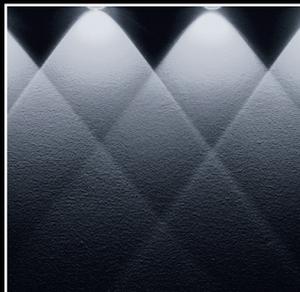

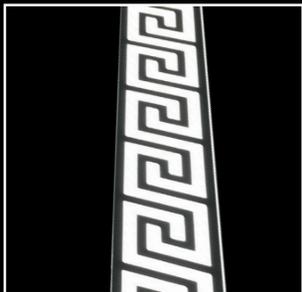

In the constant search for new solutions, technologies and materials, Aldabra has developed some innovative product lines. We have combined traditional materials such as stainless steel and aluminum with new generation polymers and nanotechnologies in the perfect combination for reliable professional electronics and high efficiency LEDs.

This perfect mix of pure innovation and quality with great attention to energy saving and eco-sustainable materials.

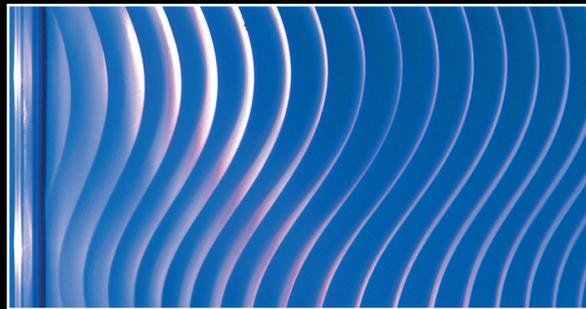

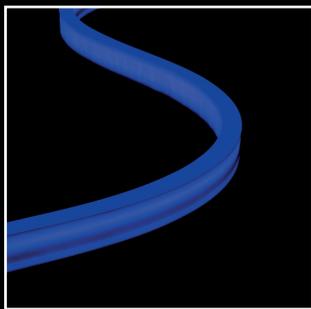

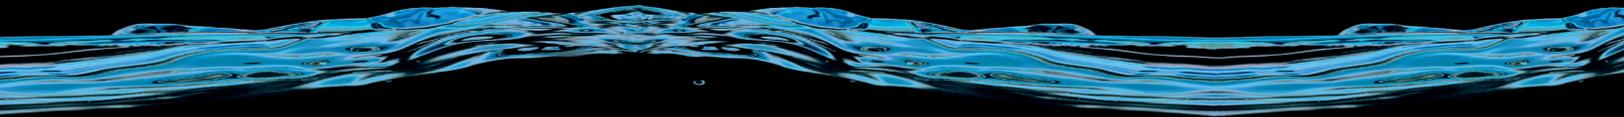

We have studied solutions designed specifically for the nautical sector that allow a total guarantee against the ingress of water into products as well as resistance to sea salt and bad weather.

The Marine collection is characterized by luminaires where LEDs and electronics are completely impregnated with nanopolymer resins that make them highly transparent, water proof and therefore suitable for use in marine contexts and underwater applications.
